Instance variable versus Class variable

Two instances of class Box

Two instances of class Circle

- In class **Box** and class **Circle**, we declared three variables (x, y, w) and (x, y, r), respectively.
- Such a variable is called **instance variable**.
- They are so called because each instance of the class, say, **Circle**, has its own copy.

CSE

Instance variable versus Class variable

- Java does not allow global variables.
- Every variable in Java must be declared inside a class.
- The keyword **static** is used to make a variable just like global variable.
- A variable declared with **static** keyword is called **class variable**.
- It acts like a global variable, that is, there is only one copy of the variable associated with the class.
That is, one copy of the variable regardless of the number of instances of the class.

Static variable : An example

```
public class Circle{  
    static int circlecount = 0; // class variable  
    public double x,y,r; // instance variables  
    public Circle(double x, double y, double r){  
        this.x = x; this.y = y; this.r = r;  
        circlecount++;  
    }  
    public Circle(double r){  
        this(0.0,0.0,r);  
        circlecount++;  
    }  
    public Circle(Circle c){  
        this(c.x,c.y,c.r);  
        circlecount++;  
    }  
    public Circle(){  
        this(0.0,0.0,0.1);  
        circlecount++;  
    }  
}
```

```
public double circumference(){  
    return (2*3.14159*r);  
}  
public double area(){  
    return(3.14159*r*r);  
}  
public static void main(String args[ ]){  
    Circle c1 = new Circle();  
    Circle c2 = new Circle(5.0);  
    Circle c3 = new Circle(c1);  
    System.out.println("c1#" + c1.circlecount + "c2#" +  
                       c2.circlecount + "c3#" + c3.circlecount);

Nested class in Java

- In Java, a class can be defined inside a class. Let us look at the following example.

```
class Circle{  
    static double x,y,r;  
    Circle(double r){  
        this.r = r;  
    }  
    // Following is the nested class  
    public static class Point{  
        double x, y;  
        void display(){  
            System.out.println("(x,y): (" + this.x + "," + this.y + ")");  
        }  
        Point(double a, double b){  
            this.x = a;  
            this.y = b;  
        }  
    }  
}
```

Recursion in Java : GCD calculation

For any two integers m and n (such that $m < n$), the $GCD(m, n)$ calculation can be defined recursively as follows.

```
GCD(m, n) = GCD(n, m) if m>n;  
GCD(m, n) = n, if m = 0;  
GCD(m, n) = 1, if m = 1;  
GCD(m, n) = m, If m = n;  
GCD(m, n) = GCD(m, n%m);
```

```
public class RecursiveGCD {  
    int m, n;  
    int gcd(int m, int n){  
        if(m>n) return gcd(n,m);  
        if(m==n) return m;  
        if(m==0) return n;  
        if(m==1) return 1;  
        return gcd(m,n%m);  
    }  
  
    public static void main(String[] args) {  
        RecursiveGCD g = new RecursiveGCD();  
        g.m = Integer.parseInt(args[0]);  
        g.n = Integer.parseInt(args[1]);  
        System.out.printf("GCD of %d and %d is %d.", g.m, g.n, g.gcd(g.m, g.n));  
    }  
}

Concept of inheritance

Single multi-level inheritance

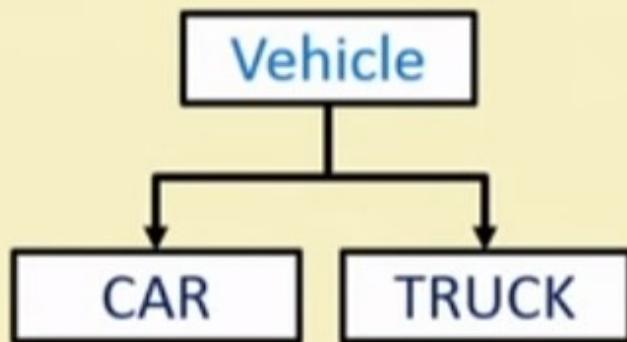

Class hierarchy

Inheritance in Java

- Inheritance is one of the cornerstone of object-oriented programming because it allows the creation of hierarchical classification.
- Using inheritance, one can create a general class that include some common set of items.
- This class then can be used to create more specific classes which has all the items from the base class, in addition to some items of its own.

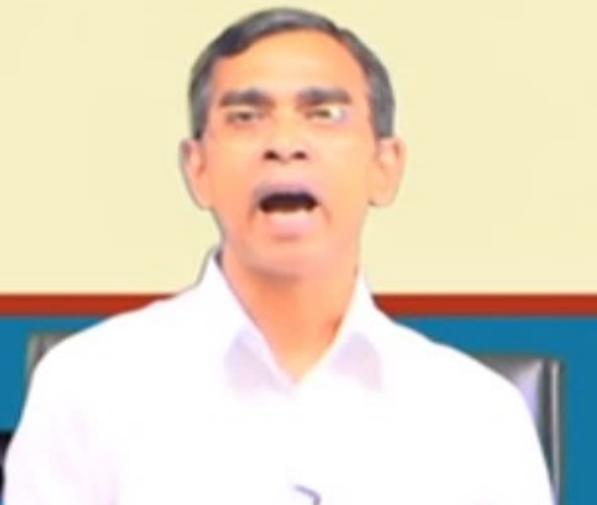

IIT KHARAGPUR

NPTEL

CSE

Terms used in inheritance

- **Superclass:** A class that is inherited is called a superclass.
- **Subclass:** The class that does inheriting is called a subclass.
 - A subclass is a specialized version of a superclass
 - It inherits all of the instance variables and methods defined by the superclass and add its own, unique elements (i.e., variables and methods)
- **Reusability:** It is a mechanism which facilitates you to reuse the data and methods of the existing class when one create a new class.
 - One can use the same data and methods already defined in the previous class.

DEBASIS SAMANTA

CSE

Inheritance syntax

- The **extends** keyword is used to define a new class that derives from an existing class. The meaning of "extends" is to increase the functionality.

```
class <Subclass-name> extends <Superclass-name> {  
    //data and methods in this sub-class  
}
```

Method overriding concept

Usage of Java Method Overriding

- Method overriding is used to provide the specific implementation of a method which is already provided by its superclass.
- Method overriding is used for runtime polymorphism

Rules for Java Method Overriding

- The method must have the same name as in the parent class
- The method must have the same parameter as in the parent class.
- There must be an IS-A relationship (inheritance).

Method overriding : An example

```
class Point2D{  
    int x;  
    int y;  
    Point2D(int a, int b){  
        x = a;  
        y = b;  
    }  
    void display(){  
        System.out.println("x = "+x+"y = "+y);  
    }  
}
```

```
class Point3D extends Point2D{  
    int z;  
    Point3D(int c){  
        z = c;  
    }  
    void display(){  
        System.out.println("x = "+x+"y = "+y+"z = "+z);  
    }  
}
```

```
class MethodOverridingTest{  
    public static void main(String args[]){  
        Point2D p = new Point2D(3.0, -4.0);  
        p.display(); // Refers to the method in Point2D  
  
        Point3D q = new Point3D(0.0);  
        q.display(); // Refers to the method in Point3D  
  
        Point2D x =(Point2D) q; // Cast q to an instance of class Point2D  
        x.display();  
    }  
}
```

DEBASIS SAMANTA
CSE

super Keyword concept in Java

The **super** keyword in Java is a reference variable which is used to refer immediate parent class members.

Whenever you create an instance of a sub class, an **instance of its parent class is created implicitly**, which is referred by **super** keyword.

IIT KHARAGPUR

NPTEL
ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

super : Referring parent class instance variable

```
class Animal{
    String color="white";
}
class Dog extends Animal{
    String color = "black";
    void printColor(){
        System.out.println(color);
        System.out.println(super.color);
    }
}
class TestSuper1{
    public static void main(String args[]){
        Dog d = new Dog();
        d.printColor();
    }
}
```

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

super : Referring parent class instance variable

```
class Animal{  
    String color="white";  
}  
class Dog extends Animal{  
    String color = "black";  
    void printColor(){  
        System.out.println(color);  
        System.out.println(super.color);  
    }  
}  
class TestSuper1{  
    public static void main(String args[]){  
        Dog d = new Dog();  
        d.printColor();  
    }  
}
```

black
white

Animal and **Dog** both classes have a common property color. If you print the color property, it will print the color of the current class by default. To access the parent property, you should use **super** keyword.

super : Invoking parent class method

```
class Animal{
    void eat(){System.out.println("eating...");}
}
class Dog extends Animal{
    void eat(){System.out.println("eating bread...");}
    void bark(){System.out.println("barking...");}
    void work(){
        super.eat();
        bark();
        eat();
    }
}
class TestSuper2{
    public static void main(String args[]){
        Dog d = new Dog();
        d.work();
    }
}
```

Animal and Dog both the classes have eat() method. If you call eat() method from Dog class, it will call the eat() method of Dog class by default because priority is given to local.

To call the parent class method, you need to use super keyword.

eating...
barking...
Eating bread...

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

super : Invoking parent class constructor

```
class Animal{
    Animal(){System.out.println("animal is created");}
}

class Dog extends Animal{
    Dog(){
        super();
        System.out.println("dog is created");
    }
}

class TestSuper3{
    public static void main(String args[]){
        Dog d = new Dog();
    }
}
```

animal is created
dog is created

The `super` keyword can also be used to invoke the overloaded parent class constructor, if arguments are there, then they should be specified accordingly.

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

super : Invoking parent class constructor

```
class Point2D{
    double x, y;
    Point2D(){x = 0.0; y = 0.0} //Default initialization
    Point2D(double x, double y){this.x = x; this.y = y;}
}
class Point3D extends Point2D{
    double z;
    Point3D(){super(); z = 0.0} //Default initialization
    Point3D(double x, double y, double z){
        super(x, y);
        this.z = z; }
}
class TestSuper4{
    public static void main(String args[]){
        Point3D p = new Point3D(2.0, 3.0, 4.0);
    }
}
```

If there is a number of overloading constructors in the super class, then you have to define the **super constructors** matching with each constructor.

Dynamic method dispatch concept

Dynamic method dispatch is a process in which a call to an overridden method is resolved at runtime rather than compile-time. Also, it is called Runtime polymorphism.

In this process, an overridden method is called through the reference variable of a super class. The determination of the method to be called is based on the object being referred to by the reference variable.

}  
  
class Splendor extends Bike{  
    void run(){System.out.println("running safely with 60km");}  
}  
  
public static void main(String args[]){  
    Splendor b1 = new Splendor();  
    b1.run();  
    Bike b2 = new Bike();  
    b2.run();  
    Bike b3 = new Splendor(); //Up casting  
    b3.run();  
}
```

For the `b3` object, we are calling the `run()` method by the reference variable of super class. Since it refers to the sub class object and sub class method overrides the super class method, the sub class method is invoked at runtime.

running safely with 60km
Running
running safely with 60km

Dynamic binding in Java: Example

```
class A {  
    void callMe ( ) {  
        System.out.println ( "I am from A " ) ;  
    }  
}  
  
class B extends A {  
    void callMe ( ) {  
        System.out.println ( "I am from B " );  
    }  
}  
  
class Who {  
    public void static main (String args [ ] ) {  
        A a = new B ( ) ;  
        a.callMe();  
        B b = new B();  
        b.callMe();  
    }  
}
```

I am from B

Abstract class in Java

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

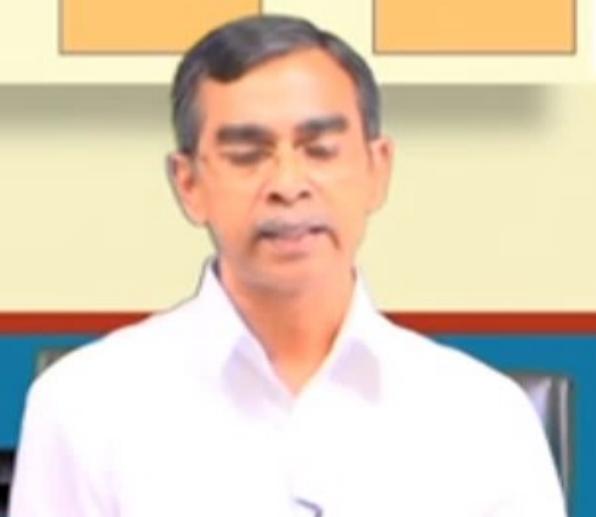

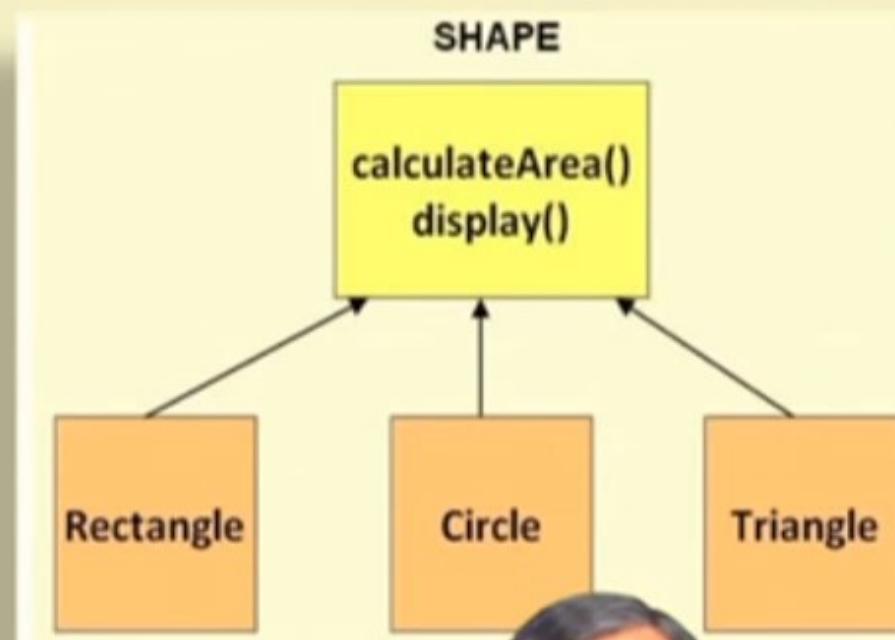

DEBASIS SAMANTA
CSE

Abstract concept

- Abstraction is a process of hiding the implementation details and showing only functionality to the user.
- Abstraction lets you focus on what the object does instead of how it does it.
- A class which is declared with the **abstract** keyword is known as an **abstract class** in Java. It can have abstract and non-abstract methods (i.e., method with the body only without its definition).

Abstract concept

Points to remember

- An **abstract class** must be declared with an **abstract** keyword.
- It can have abstract and non-abstract **methods**.
- It **cannot be instantiated**.
- It can have constructors and static methods also.
- It can have **final methods** which will force the sub class not to change the body of the method.

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

Abstract class in Java : Example

```
abstract class Bike{
    abstract void run();
}

class Honda extends Bike{
    void run(){
        System.out.println("Running safely");
    }
}

public static void main(String args[]){
    Bike obj = new Honda();
    obj.run();
}
```

Running safely

Here, `Bike` is an `abstract class` that contains only one `abstract method run()`.

Its implementation is provided by the `Honda` class.

Note:

An `abstract method` should be defined in its `sub class`.

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

final keyword concept

The **final** keyword in Java is used to restrict the access of an item from its super class to a sub class. The Java **final** keyword can be used in many context.

- Variable : a variable cannot be accessed in sub class
- Method : a method cannot called from a sub class object
- Class : a class cannot be sub classed.

Note:

If you make any class as **final**, you cannot extend it.

Hey, I'm final!
You can not
change my value,
You cannot
override me
you can not
inherit me

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

Final class in inheritance : An Example

```
final class Bike{  
  
    class Honda1 extends Bike{  
        void run(){  
            System.out.println("Running safely with 100kmph");  
        }  
  
        public static void main(String args[]){  
            Honda1 honda = new Honda1();  
            honda.run();  
        }  
    }  
}
```

Extending a class which is declared as **final** will cause **compile time error**.

Access Modifiers in Java

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

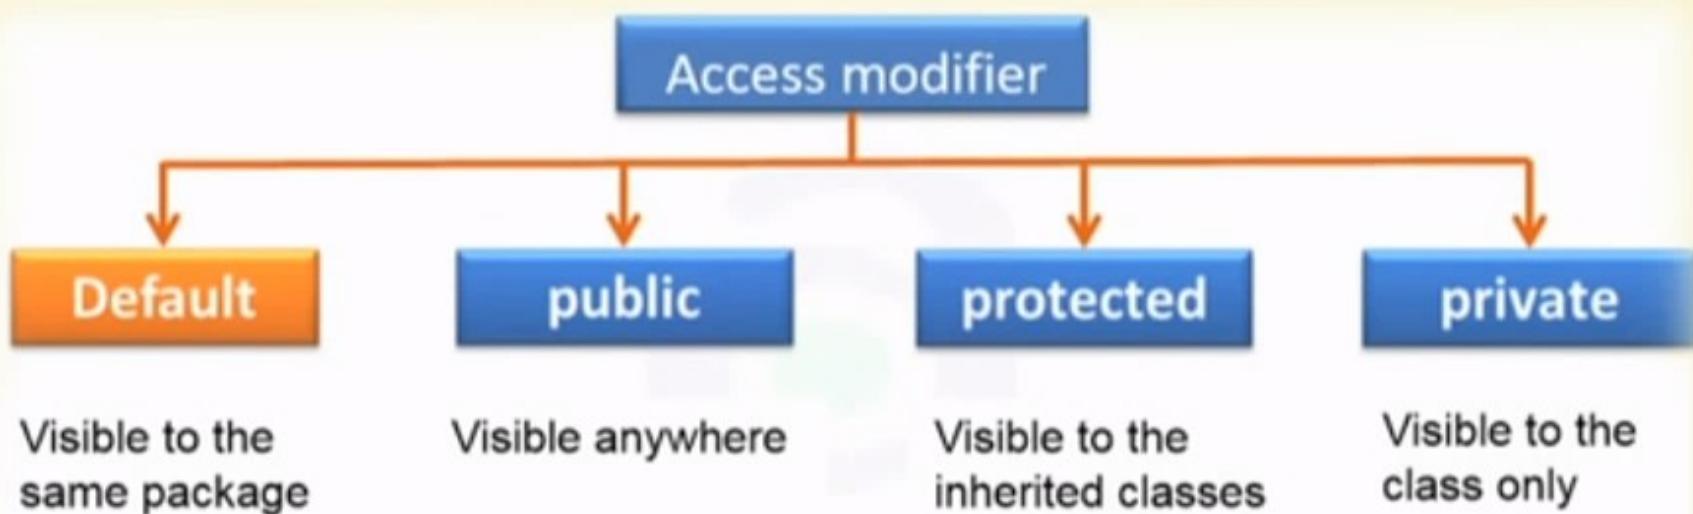

Concept of access modifiers

The **access modifiers** in Java specify accessibility (**scope**) of a data member, method, constructor or class.

Type of access modifiers :

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

Access levels of modifiers

Access levels Modifier	Class	Package	Sub class	Everywhere
Public	✓	✓	✓	✓
Protected	✓	✓	✓	✗
Default	✓	✓	✗	✗
Private	✓	✗	✗	✗

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

Default access modifier

If you don't use any modifier, it is treated as **default** by default.

The default modifier is **accessible only within a package**.

IIT KHARAGPUR

NPTEL
ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

Default access modifier : An Example

```
//Save this program as A.java in a sub-directory "pack1"

class A {
    void msg()(System.out.println("Hi! I am in Class A"));
}
```

```
/* Save this program as B.java in another
   sub-directory "pack2" */

class B{
    public static void main(String args[]){
        A obj = new A(); //Compile Time Error
        obj.msg(); //Compile Time Error
    }
}
```

Here, two classes are with default access modifier. If they reside in two different directories, then the class A is not accessible to class B and vice-versa.

However, if they reside in the same directory, then there will be no error!

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

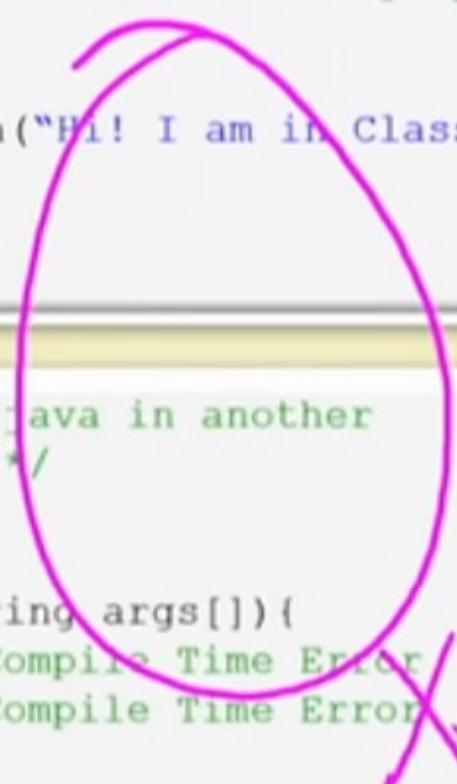

Default access modifier : An Example

```
//Save this program as A.java in a sub-directory "pack1"

class A {
    void msg(){System.out.println("Hi! I am in Class A");}
}

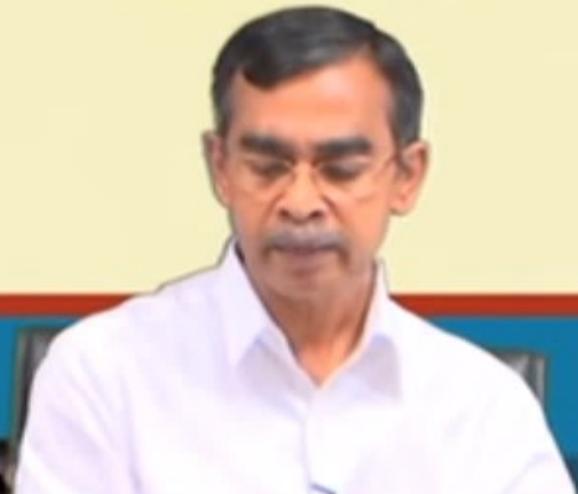

/* Save this program as B.java in another
   sub-directory "pack2" */

class B{
    public static void main(String args[]){
        A obj = new A();      //Compile Time Error
        obj.msg();            //Compile Time Error
    }
}
```

Here, two classes are with default access modifier. If they reside in two different directories, then the class A is not accessible to class B and vice-versa.

However, if they reside in the same directory, then there will be no error!

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

Default access modifier : Another example

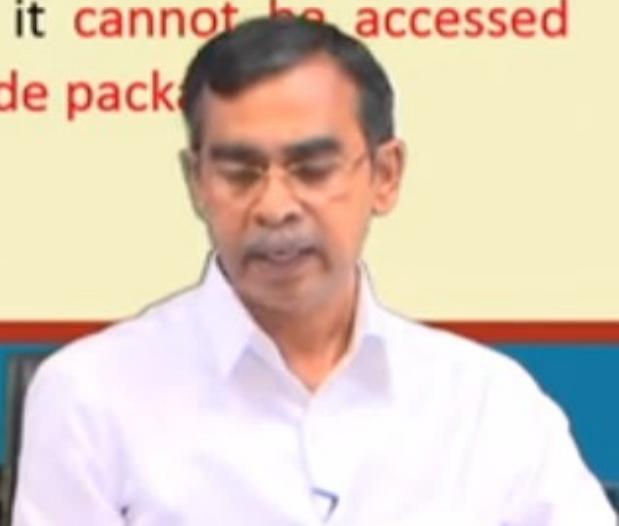

```
//Save this program as A.java
package pack1;          // It is a sub-directory "pack1"
class A {
    void msg(){System.out.println("Hi! I am in Class A");}
}
```

```
//Save this program as B.java
package pack2; //It is in a sub-directory "pack2"
import pack1.*; /* Import all class files in pack1 */

class B{
    public static void main(String args[]){
        A obj = new A(); //Compile Time Error
        obj.msg();       //Compile Time Error
    }
}
```

Suppose, there are two packages, say pack 1 and pack2.

Here, class A and class B are declared as default and we are accessing the class A from outside its package, since class A is default, so it cannot be accessed from any outside package.

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

Default access modifier : An Example

```
//Save this program as A.java in a directory, say temp.

class A {
    void msg(){System.out.println("Hi! I am in Class A");}
}
```

```
/* Save this program as B.java in the same directory */

class B{
    public static void main(String args[]){
        A obj = new A(); //Okay. It is accessible.
        obj.msg(); //It is also accessible.
    }
}
```

Here, two classes are with default access modifier, and they are residing in the same directory (or may be in the same file). Hence, in this case, the `class A` is accessible to `class B` and vice-versa.

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

Public access modifier

The **public** access modifier is **accessible** everywhere.

It has the widest scope among all other modifiers.

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

public access modifier – An Example

```
//Save as A.java in a sub-directory say pack1
package pack1;
public class A{
    public void msg(){
        System.out.println("Class A: Hello Java!");
    }
}
```

```
//Save as B.java in another sub-directory say pack2
package pack2;
import pack1.*;

class B{
    public static void main(String args[]){
        A obj = new A();
        obj.msg();
    }
}
```

The **class A** in package **pack1** is **public**, so this class can be accessed from any class outside to this package, for example, in this case, from **class B** in **pack2**.

Class A: Hello Java!

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

public access modifier : An example

```
public class A{
    public int data = 40;
    public void msg(){
        System.out.println("Class A: Hello Java!");
    }
}

public class B{
    public static void main(String args[]){
        A obj = new A();      //OK : Class A is public
        System.out.println(obj.data);          //OK : data is public
        obj.msg();                  //OK: msg is public
    }
}
```

We have created two classes **class A** and **class B**. The **class A** contains public data member and public method and are accessible to **class B**.

Note:

It does not matter whether the **class A** and **class B** belong to the same directory or in the same program file.

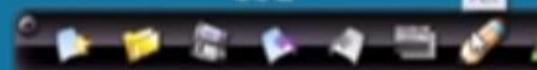

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA

CSE

Public access modifier : Another example

```
//Save this program as A.java
package pack1;          // It is a sub-directory "pack1"

public class A {
    void msg(){System.out.println("Hi! I am in Class A");}
}
```

```
//Save this program as B.java
package pack2; // It is another sub-directory "pack2"
import pack1.*; /* Import all classes in pack1 here

class B{
    public static void main(String args[]){
        A obj = new A(); //Okay program!
        obj.msg();       //This is now public
    }
}
```

When a class is public, all its member with default access specifier are also public.

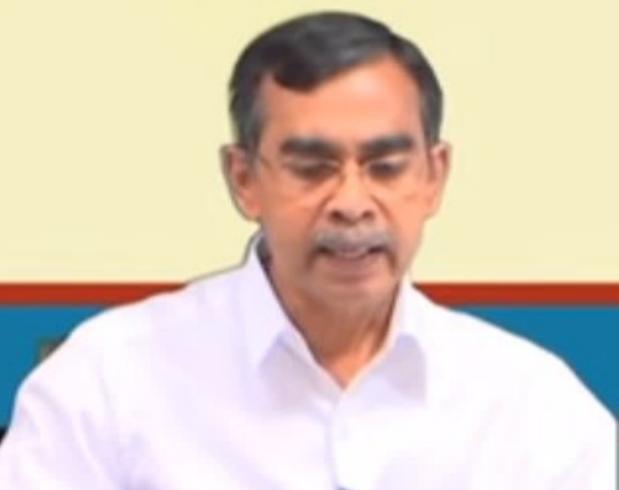

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

Public access modifier : Another example

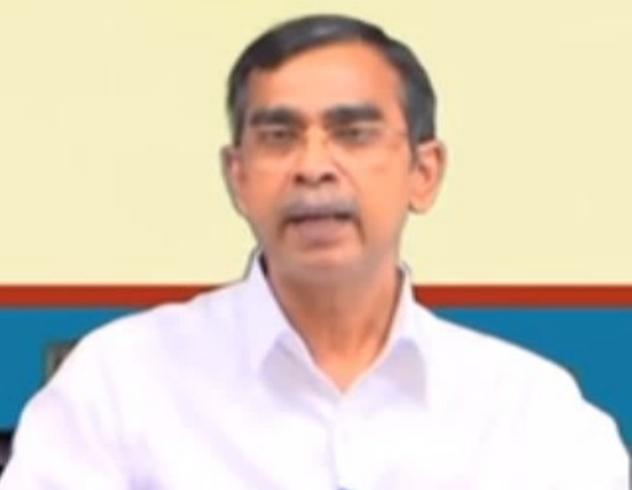

```
//Save this program as A.java
package pack1;          // It is a sub-directory "pack1"

public class A {
    void msg(){System.out.println("Hi! I am in Class A");}
}
```

```
//Save this program as B.java
package pack2; // It is another sub-directory "pack2"
import pack1.*; /* Import all classes in pack1 here

class B{
    public static void main(String args[]){
        A obj = new A(); //Okay program!
        obj.msg();       //This is now public
    }
}
```

When a class is public, all its member with default access specifier are also public.

Think about this...

```
public class A{
    private int data = 40;
    public void msg(){
        System.out.println("Hello Java!" + data);
    }
}

public class B{
    public static void main(String args[]){
        A obj = new A();      //OK : Class A is public
        System.out.println(obj.data); //Compile Time Error : data is private
        obj.msg(); //Calls msg() method of class A, which in turns private data
    }
}
```

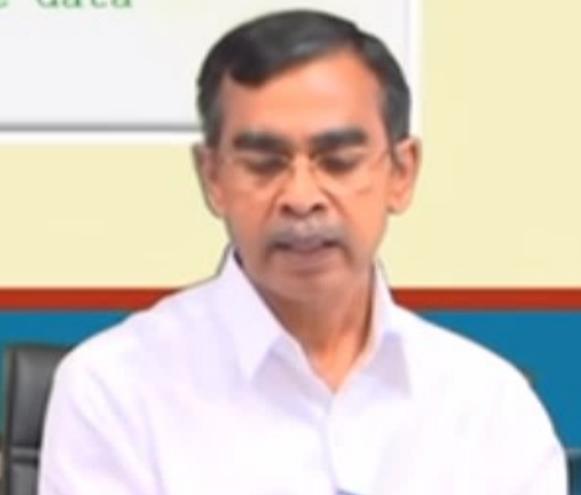

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

private constructor : An example

```
public class A{
    private A(){
        //private constructor
    }
    void msg(){
        System.out.println("Class A: Hello Java!");
    }
}

public class Simple{
    public static void main(String args[]){
        A obj = new A(); //Compile Time Error!
    }
}
```

If you make any class constructor **private**, you **can not create** an instance of that class from outside the class.

IIT KHARAGPUR

NPTEL ONLINE

Protected access modifier

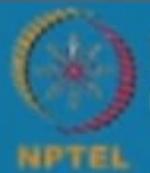

The **protected** access modifier is accessible within a package or from outside a package but through inheritance only.

The protected access modifier can be applied on the **data member**, **method** and **constructor**. It **can't** be applied on the class.

IIT KHARAGPUR

NPTEL
ONLINE
CERTIFICATION COURSES

DEBASIS SAMANTA
CSE

Protected access modifier : An Example

```
public class A{  
    protected int i = 555;  
    void msg(){  
        System.out.println("Class A: Hello Java!" + i);  
    }  
}
```

```
class B {  
    public static void main(String args[]){  
        A obj = new A();  
        obj.msg(); // Error: Compilation error  
    }  
}
```

Here, the protected data `i` is accessible to any methods in the same class. Also, it is accessible to any of its sub class.

Here, `class A` is accessible to `class B` as it is declared `public`; however, any method in the `class B` (even they are in the same file or package) cannot access `protected` data of `class A` directly or indirectly.
